Abstract: This article analyzes new approaches to teaching piano in higher education. The article examines individual approaches to piano teaching, integrated approaches, and the importance of using technology. The benefits of modern teaching methods for students and the solutions proposed to solve the problems that arise in the teaching process are analyzed in detail. The article helps to make the educational process effective and creative by applying new approaches to the development of the piano teaching methodology.

Key words: piano teaching, methodology, higher education, individual approach, integrated approach, technology, musical education, teaching methodology, assessment, motivation.

Introduction.

The piano teaching method plays an important role in the higher education system. In this article, we will talk about modern approaches, problems and solutions of piano teaching methodology.

Importance of piano lessons

The piano is one of the main instruments in classical music education, and plays an important role in the development of not only technical skills for students, but also in the formation of musical thinking and creative approach. The piano teaching methodology in higher education is aimed at increasing the effectiveness of the educational process, developing interesting and effective teaching methods for students.

Modern approaches to teaching

Individual approach

An individual approach is very important in piano lessons. Each student should be taught according to his technical capabilities, musical taste and performance technique. Teachers should conduct personal interviews with students, determine their strengths and weaknesses, and make lesson plans accordingly.

An integrated approach

An integrated approach integrates lessons related to music theory, history, composition, and other areas of piano instruction. It helps to expand musical thinking for students and deepen their musical knowledge.

Use of technologies

Modern technologies are of great help in piano teaching. Through video lessons, interactive programs, mobile applications and online platforms, students can study at a time and place convenient for them. Through these methods, effective communication and feedback can be obtained between teachers and students.

Creating a lesson plan

Setting goals

The main goals of piano lessons are the development of technical skills, the formation of musical thinking and the improvement of performance skills. Lesson plans should be made according to the individual characteristics of each student.

Selection of educational materials

Learning materials should be appropriate for students' level. Classical works, works of modern composers, as well as technical exercises and etudes should be used in the lessons. Choosing the right materials for each student will help them develop.

Evaluation and feedback

Assessing student performance and providing regular feedback is an integral part of the teaching process. Evaluation methods should be clear, objective and constructive. Through feedback, students can understand their mistakes and look for ways to correct them.

Problems and solutions

Motivational deficits

Many students suffer from a lack of motivation during piano lessons. To solve this problem, teachers need to create interesting and customized lesson plans, constantly communicate with students. Students can also be encouraged through creative projects and musical competitions.

Technical problems

Problems in piano technique can be a challenge for students. In order to solve such problems, teachers should teach technical exercises in depth, conduct additional lessons and individual exercises.

Lack of resources

A lack of resources in the teaching process, such as the lack of necessary piano instruments or technological tools, can create problems. In order to solve this problem, it is necessary to develop programs aimed at updating and expanding resources in higher education institutions.

Summary

Teaching piano in higher education provides new approaches and effective methods for teachers and students. An individual approach, an integrated approach and the use of technology are important in making the piano teaching process effective and interesting. It is necessary to look for constructive and innovative solutions to solve existing problems in the teaching process. Modern approaches to piano teaching methods help to make the learning process more effective and creative.
